Intracellular loops. STRAP-1 mRNA and protein expression is maintained at intracellular loops. STRAP-1 mRNA and protein expression is maintained at intracellular and throughout all stages of prostate cancer. STRAP-1 mRNA and/or protein is also overexpressed in certain other cancers, including and/or protein is also overexpressed in certain other cancers, including bladder, colon, pancreatic and overian cancer. The function of the STRAP proteins is not known. They may be ion channels (from the presence of six transmembrane domains, a feature which is shared by certain ion channels) transmembrane domains, a feature which is shared by certain in STRAP-1 and STRAP-2 are cell-surface tumour antigens. Immunisation with a STRAP protein induces cellular and humoral immune responses against STRAP expressing cells. STRAP proteins may be used to identify specific-binding approved the strangency targetines and to cancer the processing cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            agents, to produce anticancer vaccines and to generate specific antibodies. The antibodies may be used for detection, prognosis, and monitoring of cancers (or susceptibility to cancer), as therapeutic inhibitors or to target therapeutic agents to their site of action. STRN nucleic acids may be used for recombinant protein production, as diagnostic and prognostic reagents, for identifying STRAP-expressing cells for screening inhibitors of STRAP expression and for therapeutic modulation/inhibition of STRAP expression. Since high levels of STRAP proteins are exposed on the cell surface, they are easily targetted by systemically administered agents, and because they are expressed mainly on prostatic epithelial cells, agents targetted to them should have minimal side effects on other tissues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      homology to known human proteins. The STRAP-1 gene has been localised to chromosome 7p22. STRAP-1 is thought to be a type IIIa membrane protein and is expressed predominantly in prostate cells in normal human tissues. Structurally, STRAP-1 is a 339 amino acid protein characterised by six
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 the prostate, AAY58194). These peptides were used to raise monoclonal anti-STRAP-1 antibodies. STRAP-1 is the prototype member of the STRAP family of proteins (AAY58194-Y58197) which exhibit a high degree of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     structural conservation, but which show no significant structura
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                          six transmembrane epithelial antigen of the prostate-1; STEAP-1; chromosome 7p22.3; cancer; prostate; colon; bladder; pancreatic; ovarian; lung; extracellular loop; serpentine transmembrane antigen.

Comprises administering a vaccine comprises administering to the pastent of killing cells expressing STEAP, comprises administering a vaccine comprises administering a vaccine comprises administering a vaccine comprises administering a vaccine composition to the patient. Treating a vector encoding single chain monoclonal antibody that comprises the contains of the heavy and light chains of the monoclonal antibody that specifically binds to STEAP, such that the vector delivers the specifically binds to STEAP, such that the vector delivers the comprises the comprises chain monoclonal antibody coding sequence to the cancer cells and the encoded single chain monoclonal antibody is expressed the encoded single chain monoclonal antibody is expressed contracellularly. The present sequence is extracellular loop of STEAP-1 contracellularly. The present sequence is extracellular loop of STEAP-1 contrable for cloning into pFc, which is used in the invention. STEAP-1 contrable is located on chromosome 7p22.3

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               to treat hormonal dysfunction, cancer and other neoplasia, atherosclerosis, diabetes, in treating various anaemias or for use in conjunction with irradiation/chemotherapy to stimulate the production of erythroid precursors and/or erythroid cells. The sequences may be used to promote better or faster closure of non-healing wounds, including pressure ulcers, ulcers associated with vascular insufficiency and surgical and traumatic wounds and in generation or regeneration of other endothelium), muscle (smooth, skeletal, or cardiac) and vascular tissue or for promoting the growth of cells comprising such tissues. Sequences ABU60884-ABU60895 represent human GPCR-related proteins of the invention
                                                                                                                                                                                                                             anaemia; irradiation; erythroid precursor; erythroid cell; chemotherapy; pressure ulcer; vascular insufficiency; surgical wound; traumatic wound; precursor; erythroid cell; ulcer; organ; pressure ulcer; vascular insufficiency; surgical wound; traumatic wound; pancreas; liver; intestine; kidney; skin; endothelium; skeletal muscle; smooth muscle. Cardiac muscle.
                                                                                                                                                                                                                                                                                                                              neurological disease; immunological disease; nephritic
                                                                                                                                                                                                                                                                                                                                                                                                      Human G protein-coupled receptor-related (GPCR-related)
                                                                                                                                                                   Homo sapiens
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to human G protein-coupled receptor-like like) proteins and the polynucleotides encoding them. The isola sequences are used for the treatment of diseases of ophthalmic.

The isolated sequences are used for the treatment of diseases of ophthalmic, neurological, immunological, or nephritic systems. They may also be to treat hormonal dysfunction, cancer and other neoplasia, atherosclerosis, diabetes, in treating various anaemias or for use i conjunction with irradiation/chemotherapy to stimulate the production crythroid precursors and/or expthroid cells. The sequences may be us promote better or faster closure of non-healing wounds, including pressure ulcers, ulcers associated with vascular insufficiency and

This sequence represents a novel human protein, STRAP-1 (serpentine transmembrane antigen of the prostate). STRAP-1 is the prototype member of the STRAP family of proteins (AAYS8194-YS8197) which exhibit a high degree of structural conservation, but which show no significant concluded to chromosome 7p22. STRAP-1 is thought to be a type IIIa conditied to chromosome 7p22. STRAP-1 is thought to be a type IIIa comembrane protein and is expressed predominantly in prostate cells in cormal human tissues. Structurally, STRAP-1 is a 339 amino acid protein cormal human tissues. Structurally, STRAP-1 is a 339 amino acid protein cormal human tissues. Structurally, STRAP-1 is a 339 amino acid protein cormal human tissues. Structurally, STRAP-1 is a 339 amino acid protein cormal human tissues of termini, suggesting that it folds in a "serpentine" manner into three correcellular and two intracellular loops. STRAP-1 mRNA and protein correcellular and two intracellular loops. STRAP-1 mRNA and protein correction of smaintained at high levels and throughout all stages of correction other cancers, including bladder, colon, pancreatic and ovarian cancer. The function of the STRAP proteins is not known. They may be ion cancer. The function of the STRAP proteins is not known. They may be ion cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Domain

STRAP-1 and STRAP-2 are cell-surface cc tumour antigens. Immunisation with a STRAP protein induces cellular and cc may be used to identify specific binding agents, to produce anticancer vaccines and to generate specific antibodies. The antibodies may be used co centerly, and monitoring of cancers (or susceptibility to cancer), as therapeutic inhibitors or to target therapeutic agents to centerly as therapeutic inhibitors or to target therapeutic agents to concer), as therapeutic inhibitors or to target therapeutic agents to concers site of action. STRAP nucleic acids may be used for recombinant contein production, as diagnostic and prognostic reagents, for identifying STRAP-expressing cells for screening inhibitors of STRAP copression. Since high levels of STRAP proteins are exposed on the cell surface, they care easily targeted by systemically administered agents, and because they are expressed mainly on prostatic epithelial cells, agents targetted to them should have minimal side effects on other tissues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                S

The present invention describes polynucleotide sequences (I) which encode prostate-specific proteins (II). (I) and (II) have cytostatic activity, and can be used in vaccine production and gene therapy. (I), (II), antibodies to (II), fusion proteins comprising (II), and isolated T cells prepared using (I) or (II) are used treat cancer in a patient. (I) and the antibodies are also used in the detection of cancer in a patient. The cancer that is diagnosed or treated is particularly prostate cancer. (I) and (II) can be used in vaccines. The antibodies or (I) can be used for

            The invention relates to isolated prostate-specific polynucleotides, polypeptides, fusion proteins of the polypeptides, antibodies raised against the polypeptides (or antigenic epitopes derived from them) and antigen-presenting cells expressing the polypeptides. The antibodies are useful for detecting the presence of cancer, especially prostate cancer. The polypeptides, polynucleotides and the antigen-presenting cells are useful for stimulating and/or expanding T cells specific for a tumour protein, and for inhibiting the development of cancer especially prostate protein, and for inhibiting the development of cancer especially prostate
                                                                                                                                                                                                                                                                                                  New human prostate-specific the diagnosis and treatment

                                                           The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides are useful in gene therapy, vaccines or e.g. stem cell growth factor activity, haematopolesis regulating activity, tissue growth factor activity, haematopolesis regulating activity and may be useful in the diagnosis and/or the properties are activity and may be useful in the diagnosis and/or activity and may be useful in the diagnosis and/or the properties are activity.
treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: Records for SEQ ID NO 2110 (AAK52581), 2111 (AAK52582) and 3666 (AAM80020) are omitted as the relevant pages from to
                                                                                                                                                                                                                                                                                                                  Claim 20;
                                                                                                                                                                                                                                                                                                                                              Nucleic acids encoding polypeptides with cytokine-like activities, useful in diagnosis and gene therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention describes a fusion protein comprising at least one amino acid sequence of immunogenic portions of any of the 3 sequences not defined in the specification, or sequences having at least 70 or 90 % sequence identity to any one of the 35 sequences defined in the USPTO web site, which is encoded by any of the 4 nucleotide sequences not defined in the specification. The fusion protein, composition and methods are useful for diagnosing, preventing and/or treating cancer, particularly prostate cancer. The proteins are useful as markers to indicate the presence or absence of cancer. This is the amino acid sequence of a presence or absence of cancer. This is the amino acid sequence of a prostate cancer therapy associated protein. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the US patent office at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CC The present invention relates to methods of detecting a prostate cancer-
CC contacting a biological sample from the patient with prostate cancer-
CC contacting a biological sample from the patient with prostate cancer-
CC associated polymuclectides (designated PC genes) that selectively
CC hybridise to a sequence that is at least 80% identical to them. The
CC prostate cancer-associated polymuclectide sequences are differentially
CC expressed in prostate tumour tissue or in prostate cancer and are derived
CC from the tissues of various organisms such as humans or other mammals
CC (e.g. mice, sheep and dogs). The methods of the invention are useful for
CC diagnosing and treating prostate cancer in mammals. The prostate cancer
CC associated genes are useful for diagnosing or treating prostate cancer.
CC associated genes are useful for diagnosing or treating prostate cancer.
CC associated genes are useful for diagnosing or treating prostate cancer.
CC associated genes are useful for diagnosing or treating prostate that
CC useful in gene therapy, as a vaccine or in antisense applications.
CC ABG61800-ABG61944 represent prostate cancer-associated proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention describes a composition comprising a substance that modulates the status of a protein (1) of 340 or 283 amino acids, or of any of the 15 sequences of 259 amino acids, given in the specification, or a molecule that is modulated by the protein, where the status of the cell that expresses the protein is modulated. The compositions, proteins, polynucleotides and methods are useful for treating and detecting cancer. The STEAP-1 related proteins are useful for generating cancer vaccines. The polynucleotides are useful as tools for delineating, with greater precision, cytogenetic abnormalities in the chromosomal region that encodes STEAP-1 that may contribute to the malignant phenotype. This is the amino acid sequence of a variant of human six transmembrane epithelial antigen of the prostate or STEAP-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New composition comprising a substance that modulates the status of STEAP-1-related protein, useful for treating and detecting cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Example 2; Fig 2A; 248pp;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ABU98414 standard;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ABU98414;
The invention describes a composition comprising a substance that modulates the status of a protein (I) of 340 or 283 amino acids, or any of the 15 sequences of 259 amino acids, given in the specific or a molecule that is modulated by the protein, where the status of the compositions, protein that expresses the protein is modulated. The compositions, protein that expresses the protein is modulated.
                                                                                                                                                                                                                                                                                                                                                                                                  Homo sapiens

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               polynucleotides and methods are useful for treating and detecting cancer. The STEAP-1-related proteins are useful for generating cancer vaccines. The polynucleotides are useful as tools for delineating, with greater precision, cytogenetic abnormalities in the chromosomal region that encodes STEAP-1 that may contribute to the malignant phenotype. This is the amino acid sequence of a variant of human six transmembrane epithelial antigen of the prostate or STEAP-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 339 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            31-JUL-2003
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ABU98430;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             STEAP-1 variant 8P1D4 v.1
                         The invention describes a composition comprising a substance that modulates the status of a protein (I) of 340 or 283 amino acids, or of any of the 15 sequences of 259 amino acids, given in the specification, or a molecule that is modulated by the protein, where the status of the cell that expresses the protein is modulated. The compositions, proteins, polynucleotides and methods are useful for treating and detecting cancer. The STEAP-1-related proteins are useful for generating cancer vaccines. The polynucleotides are useful as tools for delineating, with greater precision, cytogenetic abnormalities in the chromosomal region that encodes STEAP-1 that may contribute to the malignant phenotype. This is the amino acid sequence of a variant of human six transmembrane epithelial antigen of the prostate or STEAP-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Homo sapiens.
                                                                                                                                                                                                                                                           New composition STEAP-1-related
                                                                                                                                                                                                                                                                                                                                       Faris M,

                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to novel prostate-specific proteins (PSP) and their coding sequences. The PSPs and their coding sequences are useful for stimulating an immune response in a patient, or for treating prostate cancer in a patient and for determining, detecting or diagnosing the presence of a cancer in a patient. The present sequence was used to illustrate the invention
                                                                                                                                                                                                                                                                                                                                                           Sequence 339 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Example 5; Page 618-619; 691pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New prostate-specific proteins and genes, useful in gene therapy, particularly for stimulating an immune response in a patient, or treating prostate cancer in a patient, as well as for diagnosing prostate cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Xu J, Dillon DC, Mitcham JL, Harlocker SL, Jiang Y, Henderson RA; Kalos MD, Fanger GR, Retter MW, Stolk JA, Day CH, Vedvick TS; Carter D, Li SX, Wang A, Skeiky YAW, Hepler WT, Hural J; Mcneill PD, Houghton RL, Vinals Y De BassolsC, Foy TM, Watanabe Y; Deng T;
